

Connecting generations

JSM Group has developed a range of established methods for the rapid installation of electricity infrastructure whilst minimising the impact on the environment.

Our client base includes blue chip Distribution Network Operators, National Grid, major renewable energy and commercial developers and other infrastructure owners throughout the UK.

We have established a foundation of recognition in providing services aligned to our clients' commercial requirements through attentive, collaborative relationships.

As our business has developed, we have pursued a Continual Investment Programme in critical areas within the Electricity sector to ensure our standards remain at the highest level including:

- Recruitment and retention of the industry's most experienced and skilled workforce
- Senior Management and Senior Authorised Engineers to 132kV
- Cable Jointers to 400kV
- Overhead Linesmen
- Electrical Substation Fitters

Clients recognise that our commitment to delivering quality services is focused on specific needs and backed-up with years of experience and know-how, where necessary we can also advise in a consulting role.

The company can utilise its extensive world leading trenchless technology knowledge to minimise disruption on major reinforcement schemes to remove redundant or end of life buried cables and using the same process replace with new or overlay cables or ducting. This is a safer, more environmentally sound whilst causing minimal disruption method as an alternative to open trenching or for specialist crossings of obstructions.

By understanding our clients' investment objectives and the needs of working in a regulated business, we make the project process an enjoyable, professional and rewarding experience for both parties.

We provide electricity suppliers, developers and statutory bodies with a single point of contact for solutions to meet the requirements of their particular development.

We provide technically advanced, efficient and superior quality services to electricity companies.

Since deregulation, OFGEM has encouraged competition in the connections industry. In response to that, we have established a specialist division within the Company to serve this market.

This ensures effective management of projects.

With a qualified, skilled and committed workforce and with Integrated Management Systems accredited to ISO 9001, ISO 14001 & ISO 18001 and certification from Lloyds Register, Construction Line and Chas we deliver consistently to high standards, providing customers with reliable installations.

We can provide a full construction as well as commissioning service for electricity connections, taking installations from an initial brief to handing over the completed services.

Our Total Project Management approach to project and scheme delivery means that we always work closely with all stakeholders to arrange permissions and manage all logistics, ensuring an efficient and trouble-free end to end installation.

JSM have delivered renewable energy source connections and continue to work with developers in this specialist area providing a true end to end ICP service.
